An embodiment of control means 53 determines if the utility power drawn is above a manually pre-set threshold or a threshold derived from an automatic setpoint circuit. If the utility power drawn exceeds this threshold, voltage regulator means 52 output voltage will be set such that power junction means 55 will be biased accordingly such that power to DC loads 57 will be drawn from storage battery 2 and/or PV source 25 through its PV voltage and suppressor 54. In this manner, AC power peaks from the utility are reduced as are monthly utility charges if a peak power surcharge is assigned. The power sharing between PV source 25 and battery 2 is regulated by the output voltage of PV source 25 as modified by PV voltage regulator and suppressor 54. The interaction of voltage output at suppressor 54 with that of battery 2 voltage via biasing within power junction means 54 determines the level of power sharing between these DC secondary sources. The latter action also describes the sharing of power between PV panel 25 and battery 2 during periods of utility power outage. - -

IN THE CLAIMS:

Please amend Claim 49 as follows:

Sob
fi

~~49. (Amended) A [universal] power system sharing AC and DC power for powering DC compatible loads, said power system utilizing a power controller capable of inputting multiple power sources, including at least one primary~~

*Sub
f1*

source of AC or DC electrical power of singular or variable voltage and at least one secondary power connection for processing external DC electrical power in service to at least one DC compatible load at its output, such as a lighting fixture requiring DC electrical power, said system comprising:

*Cont
B*

 said power controller converting said primary electrical power into a defined DC-regulated voltage used to provide and manage end-use service power;

 said power controller having said at least one secondary power connection for processing at least one external alternative DC power source in readiness for service to said at least one DC compatible load; and,

 said power controller having circuitry at said secondary power connection for combining said alternative DC power source with said voltage regulated DC voltage in service to said at least one DC compatible load.

Remaining pending Claims 50-56 and 89-90 read as follows:

RE

50. (Previously Amended) The universal power system of Claim 49 wherein said at least one secondary power connection comprises at least two secondary power connections including one first secondary power connection and at least one second secondary power connection.

51. (Previously Amended) The universal power system of Claim 49 wherein said alternative DC power source is at least one external electrical storage medium, said at least one secondary connection for said electrical storage medium having circuitry for managing the state of charge for said electrical storage medium.

52. (Unchanged) The universal power system of Claim 49 wherein said alternative DC power source is at least one supplemental source of power capable of providing DC electricity.

53. (Previously Amended) The universal power system of Claim 50 wherein said at least one alternative DC power source is an external electrical storage medium, said at least one secondary connection for said electrical storage medium having circuitry for managing the state of charge for said electrical storage medium.

54. (Unchanged) The universal power system of Claim 50 wherein said second secondary alternative DC power source is at least one supplemental source of power capable of providing DC electricity.

55. (Previously Amended) The universal power system of Claim 50 wherein said first secondary alternative DC power source is at least one external electrical storage medium

and said second secondary alternative DC power source is at least one supplemental source capable of providing DC electricity.

56. (Previously Amended) The universal power system as in Claim 50 further comprising said power controller having circuitry for combining power from said at least one first secondary power connection and said at least one second secondary power connection in service to said at least one DC compatible load, in the absence of said primary electrical power source.

89. (Previously Amended) The universal power system of Claim 49 wherein said power system is a voltage regulated power system of higher quality, said primary source of power being any naturally occurring variable voltage AC or DC source of power with optional use of at least one supplemental source of secondary power.

90. (Previously Amended) The universal power system of Claim 50 wherein said power system is a voltage regulated power system of higher quality, said primary source of power being any naturally occurring variable voltage AC or DC source of power with optional use of at least one supplemental source of secondary power.

~~Please cancel Claims 1-4, 7, 9, 10, 16, 19, 22-31, 34-~~

48, 57-88 and 91-114 as follows:

1. (Canceled) A universal power system utilizing a first power control circuit including a primary AC or DC electrical power source of variable voltage for maintaining normal lighting conditions by at least one DC load, such as a lighting fixture utilizing DC electrical power as its power source comprising:

a power controller receiving the primary AC or DC electrical power and delivering voltage regulated DC electrical power to said DC load;

said power controller converting said AC electrical power to produce converted and voltage regulated DC electrical power;

said power controller including a voltage regulator, said controller providing said voltage regulated DC power for said at least one DC load;

said power controller having a second power control circuit for optionally connecting and maintaining a second power source such as an external rechargeable storage battery in readiness for service to said at least one lighting fixture;

said power controller having a third power control circuit for optionally connecting and proportionately combining a third power source such as an external DC power source with said primary or DC power source, in service to said at least one DC load and said optional storage battery;

said power controller in the absence of the primary AC or DC electrical power source capable of combining power from said second power source and said third power source in service to said at least one DC load and to said second power control circuit to charge said second optional storage battery,

 said power controller having a third power control circuit for proportionately combining at least one external power source in service to said at least one lighting fixture and/or said storage battery.

2. (Canceled) The universal power system of Claim 49 further comprising multiple power controllers in service to lighting loads greater than a predetermined capacity of said power controller.

3. (Canceled) The universal power system of Claim 49 further comprising a photovoltaic source of DC electrical power connected to said power controller for reducing the amount of AC electrical power taken from said primary AC or DC power source when said AC electrical power reaches a predetermined limit.

4. (Canceled) A high efficiency lighting system for lighting fixtures requiring DC electrical power comprising:

power control means for receiving AC electrical power from a grid source and delivering required DC electrical power to said lighting fixtures;

 said power control means converting said AC electrical power to DC electrical power;

 photovoltaic means for delivering DC electrical power through said power control means;

 said power control means reducing the electrical power taken from said grid source by the amount of electrical power supplied by said photovoltaic means and

 battery means for providing on a standby basis said required DC electrical power to said power control means, said power control means maintaining said battery means in a fully charged condition by electrical power from said grid source.

7. (Canceled) The universal power system as in Claim 49, further comprising a DC power cogenerator connected to said first primary power source, said third power source or both said first primary power source and said third power source.

9. (Canceled) The universal power system as in Claim 49 for DC loads requiring DC electrical power further comprising:

said at least one DC load comprising a plurality of DC loads distributed throughout a building, each of said DC loads requiring DC electrical power for operations;

 said power controller receiving said AC electrical power from a grid source and delivering voltage regulated DC electrical power to said DC loads;

 said power controller converting said AC electrical power to voltage regulated DC electrical power;

 said rechargeable DC power source providing on a standby basis said required voltage regulated DC electrical power through said power controller;

 said rechargeable DC power source being connected to said voltage regulating power controller and being maintained in a fully charged condition by said power controller during normal supply of AC electrical power from said primary AC electrical power source;

 said power controller delivering DC electrical power from said rechargeable DC power source to said DC loads during an interruption from the primary first power source to maintain without interruption of normal operation of the DC loads, and

 said power controller also directing said DC electrical power from said rechargeable DC power source to said loads through a voltage change of said power controller,

 said power controller also directing a fractional portion of said required electrical power to said DC loads from said rechargeable DC power source by means of a

proportionate change in level of said regulated voltage provided by said power controller.

10. (Canceled) The universal power supply system of Claim 9 further comprising a photovoltaic source of DC electrical power connected to said power controller for reducing the amount of electrical power taken from said primary AC or DC power source.

16. (Canceled) The universal power system as in Claim 9 wherein said at least one DC load is a at least one lighting fixture.

19. (Canceled) The universal power system as in Claim 49 wherein said DC at least one load is a household appliance.

22. (Canceled) The universal power system as in Claim 49 comprising:

 said at least one DC load comprising a plurality of lighting fixtures distributed throughout a building, each of said fixtures requiring DC electrical power for operation,

 said power controller being in close proximity with said at least one DC load such that voltage drops in supporting cabling is minimized.

23.. (Canceled) The universal power system of Claim 22 having a rechargeable DC power source providing on a standby basis said required DC electrical power to said power controller, during an AC electrical outage to maintain without interruption normal lighting by said lighting fixtures,

 said rechargeable DC power source being connected to said power controller for being maintained in a fully charged condition by said power controller during normal supply of AC electrical power from said grid source, and supplying DC electrical power to said lighting fixtures when there is an AC power outage.

24. (Canceled) A universal power system utilizing AC electrical power from a grid source for maintaining normal lighting conditions by lighting fixtures requiring DC electrical power comprising:

 a voltage regulating power controller receiving AC electrical power from a grid source and delivering required low voltage DC electrical power to said lighting fixtures;

 said power controller converting said AC electrical power to voltage regulated DC electrical power;

 a rechargeable DC power source providing on a standby basis said required DC electrical power through said power controller when said AC electrical power reaches a predetermined threshold limit;

said rechargeable DC power source being connected to said power controller for being maintained in a fully charged condition by said power controller during normal supply of AC electrical power from said grid source; and

 said voltage regulating power controller limiting said converted AC electrical power to DC electrical power when load requirements exceed said predetermined threshold limit, wherein said rechargeable DC power source provides any additional required DC electrical power.

25. (Canceled) A high efficiency lighting system for maintaining normal lighting conditions by lighting fixtures requiring DC electrical power comprising:

 power control means for receiving AC electrical power from a grid source and delivering required DC electrical power to said lighting fixtures;

 said power control means converting said AC electrical power to DC electrical power;

 battery means for providing on a standby basis said required DC electrical power through said power control means;

 said battery means being connected to said power control means for being maintained in a fully charged condition by said power control means during normal supply of AC electrical power from said grid source;

 said power control means delivering said required DC electrical power from said battery means to said lighting

fixtures during an AC electrical power outage to maintain without interruption normal lighting by said lighting fixtures; and,

a photovoltaic source of DC electrical power connected to said power control means for reducing the amount of electrical power taken from said grid source.

26. (Canceled) A high efficiency lighting system for lighting fixtures requiring DC electrical power comprising:

power control means for receiving AC electrical power from a grid source and delivering required DC electrical power to said lighting fixtures;

said power control means converting said AC electrical power to DC electrical power;

photovoltaic means for delivering DC electrical power through said power control means;

said power control means reducing the electrical power taken from said grid source by the amount of electrical power supplied by said photovoltaic means.

27. (Canceled) The high efficiency lighting system of Claim 26 having battery means for providing on a standby basis said required DC electrical power to said power control means, said power control means maintaining said battery means in a fully charged condition by electrical power from said grid source, for maintaining without

interruption the normal lighting by said lighting fixtures during a power outage.

28. (Canceled) A universal power system for maintaining normal lighting conditions by lighting fixtures requiring DC electrical power comprising:

a power controller for receiving DC electrical power from a photovoltaic panel and delivering required DC electrical power to said lighting fixtures;

said power controller controlling charging of a rechargeable DC power source;

said rechargeable DC power source providing on a standby basis said required DC electrical power through said power controller;

said power controller including a regulator receiving the voltage and the DC electrical power, said controller providing voltage regulated DC power;

said rechargeable DC power source being connected to said power controller for being maintained in a charged condition by said power control means during hours of input from said photovoltaic panel, and

said power controller delivering said required DC electrical power from said rechargeable DC power source to said lighting fixtures during periods of time when power from said photovoltaic panel is not available.

29. (Canceled) A DC power supply system for DC loads requiring DC electrical power comprising:

power control means for receiving AC electrical power from a grid source and delivering required DC electrical power to said DC load;

said power control means converting said AC electrical power to DC electrical power;

battery means for providing on a standby basis said required DC electrical power through said power control means;

said battery means being connected to said power control means for being maintained in a fully charged condition by said power control means during normal supply of AC electrical power from said grid source;

said power control means delivering said required DC electrical power from said battery means to said DC load during an AC electrical power outage to maintain without interruption normal operation of the DC load; and,

a photovoltaic source of DC electrical power connected to said power control means for reducing the amount of electrical power taken from said grid source.

30. (Canceled) A universal power system for DC loads requiring DC electrical power comprising:

a power controller receiving DC electrical power from a stand alone DC power source not connected to a grid supplied

AC electrical power source and delivering required DC electrical power to said DC load;

 said power controller controlling charging of a rechargeable DC power source;

 said rechargeable DC power source providing on a standby basis said required DC electrical power through said power controller;

 said power controller including a regulator receiving the voltage and the DC electrical power, said controller providing voltage regulated DC power;

 said rechargeable DC power source being connected to said power controller for being maintained in a fully charged condition by said power controller during hours of input from said DC power source, and

 said power controller delivering said required DC electrical power from said rechargeable DC power source to said DC load during periods of time when power from said DC power supply is not available.

31. (Canceled) The universal power system as in Claim 9 wherein said second DC power source is a photovoltaic panel.

34. (Canceled) A high efficiency lighting system for maintaining normal lighting conditions by lighting fixtures requiring DC electrical power comprising:

power control means for receiving AC electrical power from a grid source and delivering required DC electrical power to at least one DC load means;

 said power control means converting said AC electrical power to DC electrical power;

 battery means for providing on a standby basis said required DC electrical power through said power control means;

 said battery means being connected to said power control means for being maintained in a fully charged condition by said power control means during normal supply of AC electrical power from said grid source;

 said power control means limiting said converted AC electrical power to DC electrical power when said AC electrical power reaches a predetermined limit; wherein said battery means provides deficit any additional DC electrical power; and,

 said power control means interconnecting a first DC power supply means, a second direct current power supply means and said at least one DC load means for operation in one of three modes,

 first, a mode in which said first DC power supply means supplies all of the power for said at least one DC load means, and,

 second, a mode in which said first DC power supply means and said second direct current power supply means share power to said at least one DC load means, and,

third, a mode in which said second direct current power supply means supplies all the power for said at least one DC load means.

35. (Canceled) The high efficiency lighting system as defined in claim 34 wherein said at least one DC load means is a fluorescent lighting load and said direct current supply means is in the form of storage battery means or photovoltaic panel means.

36. (Canceled) A universal power system utilizing AC electrical power from a grid source for maintaining normal lighting conditions by lighting fixtures requiring DC electrical power comprising:

a power controller for receiving AC electrical power and delivering required DC electrical power to said lighting fixtures;

said power controller converting said AC electrical power to produce converted DC electrical power;

a rechargeable DC power source for providing on a standby basis said required DC electrical power to said power controller;

said power controller including a regulator receiving the voltage and the DC electrical power, said controller providing voltage regulated DC power;

said rechargeable DC power source being connected to said power controller for being maintained in a fully

charged condition by said power controller during normal supply of AC electrical power from said grid source; and said power controller delivering said required voltage regulated DC electrical power from said rechargeable DC power source to said lighting fixtures through a voltage change of said voltage regulating power controller.

37. (Canceled) A high efficiency lighting system for maintaining normal lighting conditions by lighting fixtures requiring DC electrical power comprising:

a power controller receiving AC electrical power from a grid source and delivering required DC electrical power to said lighting fixtures, said power controller converting said AC electrical power to DC electrical power;

a rechargeable DC power source providing on a standby basis said required DC electrical power through said power controller;

said DC power source being connected to said power controller and being maintained in a fully charged condition by said power controller during normal supply of AC electrical power from said grid source;

said power controller delivering said required DC electrical power from said DC power source to said lighting fixtures during an AC electrical power outage to maintain without interruption normal lighting by said lighting fixtures; and

a photovoltaic source of DC electrical power connected to said power controller, said photovoltaic source reducing the amount of AC electrical power taken from said grid source.

38. (Canceled) The lighting system of claim 37 wherein said photovoltaic source is constructed to reduce the amount of AC electrical power taken from said grid source when said AC electrical power reaches a predetermined limit.

39. (Canceled) A high efficiency lighting system for lighting fixtures requiring DC electrical power comprising:
a power controller receiving AC electrical power from a grid source and delivering required DC electrical power to said lighting fixtures, said power controller converting said AC electrical power to DC electrical power;
a photovoltaic source of DC electrical power delivering DC electrical power through said power controller;
said power controller reducing the electrical power taken from said grid source by the amount of electrical power supplied by said photovoltaic source.

40. (Canceled) A high efficiency lighting system in accordance with claim 39, further comprising a rechargeable DC power source providing on a standby basis said required DC electrical power to said power controller, said power

controller maintaining said DC power source in fully charged condition by electrical power from said grid source.

41. (Canceled) A high efficiency lighting system in accordance with claim 40, wherein said power controller is constructed to utilize power from said DC power source to maintain without interruption the normal lighting by said lighting fixtures during a power outage.

42. (Canceled) A DC power supply system for DC loads requiring DC electrical power, comprising:

a power controller receiving AC electrical power from a grid source and delivering required DC electrical power to said lighting fixtures, said power controller converting said AC electrical power to DC electrical power;

a rechargeable DC power source providing on a standby basis said required DC electrical power through said power controller;

said DC power source being connected to said power controller and being maintained in a fully charged condition by said power controller during normal supply of AC electrical power from said grid source;

said power controller delivering said required DC electrical power from said DC power source to said lighting fixtures during an AC electrical power outage to maintain without interruption normal operation of the DC load; and

a photovoltaic source of DC electrical power connected to said power controller, said photovoltaic source reducing the amount of AC electrical power taken from said grid source.

43. (Canceled) A high efficiency lighting system for maintaining normal lighting conditions by lighting fixtures requiring DC electrical power comprising:

a power controller receiving AC electrical power from a grid source and delivering required DC electrical power to at least one DC load, said power controller converting said AC electrical power to DC electrical power;

a rechargeable DC power source providing on a standby basis said required DC electrical power through said power controller;

said DC power source being connected to said power controller and being maintained in a fully charged condition by said power controller during normal supply of AC electrical power from said grid source;

said power controller limiting the amount of AC electrical power converted to DC electrical power when said AC electrical power reaches a predetermined limit; said DC power source providing any deficit in required DC electrical power; and

said power controller interconnecting a first DC power supply, a second DC power supply and said at least one load, for operation in three modes;

a first mode in which said first DC power supply provides all of the power for said at least one load;

a second mode in which said first DC power supply and said second DC power supply share power to said at least one DC load; and,

a third, a mode in which said second DC power supply provides all the power for said at least one DC load means.

44. (Canceled) The high efficiency lighting system as in claim 43 wherein said at least one DC load is a fluorescent lighting load and said DC power supplies are in the form of one of a storage battery and a photovoltaic panel.

45. (Canceled) The universal power system as in Claim 49 wherein said rechargeable DC second power source is a storage battery.

46. (Canceled) The universal power system as in Claim 49 wherein said rechargeable DC second power source is a photovoltaic source of DC electrical power.

47. (Canceled) A high efficiency lighting system for maintaining normal lighting conditions by lighting fixtures requiring DC electrical power comprising:

a power controller receiving DC electrical power from a first DC power source and delivering required DC electrical power to at least one DC load;

a rechargeable second DC power source providing on a standby basis said required DC electrical power through said power controller;

said rechargeable second DC power source being connected to said power controller and being maintained in a fully charged condition by said power controller during normal supply of DC electrical power from said first DC power source;

said power controller limiting the amount of DC electrical power from said first DC power source when said DC electrical power reaches a predetermined rechargeable limit; said rechargeable second DC power source providing any deficit in required DC electrical power; and

said power controller interconnecting said first DC power supply, a second DC power supply and said at least one load, for operation in three modes:

a first mode in which said first DC power supply provides all of the power for said at least one load;

a second mode in which said first DC power supply and said rechargeable second DC power supply share power to said at least one DC load; and,

a third, a mode in which said second DC power supply provides all the power for said at least one DC load means.

48. (Canceled) The high efficiency lighting system as in Claim 47 wherein said at least one DC load is a fluorescent lighting load and said second DC power source is a storage battery and said third power source is and a photovoltaic panel.

57. (Canceled) The universal power system as in Claim 56 wherein said power system is a stand-alone power system capable of supporting end-use electrical loads in the absence of a central AC grid power source or any source at its primary input.

58. (Canceled) The universal power system as in Claim 56 wherein said power system is a stand-alone power system capable of supporting end-use electrical loads in the absence of a central AC grid power source at its primary input but with a local source of AC or DC power at its primary input.

59. (Canceled) The universal power system as in Claim 50 wherein said power system is a solar-assisted power system further comprising a source of AC or DC power connected to said primary input and a external photovoltaic source of DC electrical power connected to said second secondary input of said power controller in service to at least one DC load.

60. (Canceled) The universal power system of Claim 49 wherein said universal power system is an un-interruptible power system, constructed so that if the primary source of AC or DC power connected to said primary input fails, at least one DC source of rechargeable electric storage is available and connected to said at least one secondary connection of said power controller in service to said DC load.

61. (Canceled) The universal power system of Claim 50 wherein said universal power system is an un-interruptible power system, constructed so that if the primary source of AC or DC power connected to said primary input fails then at least one DC source of rechargeable electric storage is available and connected to said second secondary connection of said power controller in service to said DC load.

62. (Canceled) The universal power system of Claim 50 wherein said power system is a solar electric power system of a first type, at least one rechargeable source of DC power being connected to said first secondary connection and a photovoltaic source of nominal DC voltage being connected to said second secondary connection of said power controller in service to said at least one DC load.

63. (Canceled) The universal power system of Claim 50 wherein said power system is a solar electric power system

of a second type, a photovoltaic source of variable DC voltage being connected to said primary input of said power controller and at least one supplemental source of rechargeable DC power being connected to said first secondary connection with optional use of said second secondary connection.

64. (Canceled) The universal power system of Claim 50 wherein said power system is a solar electric power system of a third type, at least one rechargeable source of DC power being connected to said first secondary connection and a photovoltaic source of nominal DC voltage being connected to said second secondary connection of said power controller in service to a DC-to-AC line compatible inverter in order to support at least one conventional AC load.

65. (Canceled) The power system of Claim 64 wherein said power controller supports at its output a DC-to-AC line compatible inverter and at least one other DC load.

66. (Canceled) The universal power system of Claim 50 wherein said power system is a solar electric power system of a fourth type, a photovoltaic source of variable DC voltage being connected to said primary input of said power controller and at least one source of rechargeable DC power being connected to said first secondary connection, with optional use of said second secondary connection in service

to a DC-to-AC line compatible inverter in order to support at least one conventional AC load.

67. (Canceled) The power system of claim 66 wherein said power controller supports at its output a DC-to-AC line compatible inverter and at least one other DC load.

68. (Canceled) The universal power system as in Claim 50 wherein said power system includes a source of AC or DC power at said primary input and a fuel cell source of DC electrical power is connected to said second secondary connection.

69. (Canceled) The universal power system of Claim 50 wherein said power system is a fuel cell power system of a first type, at least one rechargeable source of DC power being connected to said first secondary connection and a fuel cell source of nominal DC voltage being connected to said second secondary connection of said power controller in service to said at least one DC load.

70. (Canceled) The universal power system of Claim 50 wherein said power system is a fuel cell power system of a second type, a fuel cell source of variable DC voltage being connected to said primary input of said power controller and at least one supplemental source of rechargeable DC power being connected to said first secondary connection with

optional use of said second secondary connection.

71. (Canceled) The universal power system of Claim 50 wherein said power system is a fuel cell power system of a third type, at least one rechargeable source of DC power being connected to said first secondary connection and a fuel cell source of nominal DC voltage being connected to said second secondary connection of said power controller in service to a DC-to-AC line compatible inverter in order to support at least one conventional AC load.

72. (Canceled) The power system of Claim 71 wherein said power controller supports at its output a DC-to-AC line compatible inverter and at least one other DC load.

73. (Canceled) The universal power system of claim 50 wherein said power system is a fuel cell power system of a fourth type, a fuel cell source of variable DC voltage being connected to said primary input of said power controller and at least one source of rechargeable DC power being connected to said first secondary connection with optional use of said second secondary connection in service to a DC-to-AC line compatible inverter in order to support at least one conventional AC load.

74. (Canceled) The power system of claim 73 wherein said power controller supports at its output a DC-to-AC line

compatible inverter and at least one other DC load.

75. (Canceled) The universal power system as in Claim 50 wherein alternative power source is a cogenerator connected to said second secondary input of said power controller in service to said at least one DC load.

76. (Canceled) The universal power system of Claim 50 wherein said power system is a cogenerator power system of a first type, at least one rechargeable source of DC power being connected to said first secondary connection and a cogenerator source of nominal DC voltage being connected to said second secondary connection of said power controller in service to said at least one DC load.

77. (Canceled) The universal power system of Claim 50 wherein said power system is a cogenerator power system of a second type, a cogenerator source of variable DC voltage being connected to said primary input of said power controller and at least one supplemental source of rechargeable DC power being connected to said first secondary connection with optional use of said second secondary connection.

78. (Canceled) The universal power system of Claim 50 wherein said power system is a cogenerator power system of a third type, a least one rechargeable source of DC power

being connected to said first secondary connection and a cogenerator source of nominal DC voltage being connected to said second secondary connection of said power controller in service to a DC-to-AC line compatible inverter in order to support at least one conventional AC load.

79. (Canceled) The power system of claim 75 wherein said power controller supports at its output a DC-to-AC line compatible inverter and at least one other DC load.

80. (Canceled) The universal power system of Claim 50 wherein said power system is a cogenerator power system of a fourth type, a cogenerator source of variable DC voltage being connected to said primary input of said power controller and at least one source of rechargeable DC power being connected to said first secondary connection with optional use of said second secondary connection in service to a DC-to-AC line compatible inverter in order to support at least one conventional AC load.

81. (Canceled) The power system of claim 80 wherein said power controller supports at its output a DC-to-AC line compatible inverter and at least one other DC load.

82. (Canceled) The universal power system as in Claim 50 wherein alternative power source is an alternative DC power producing source device connected to said second

secondary input of said power controller in service to said at least one DC load.

83. (Canceled) The universal power system of Claim 50 wherein said power system is an alternative DC power producing source of a first type, at least one rechargeable source of DC power being connected to said first secondary connection and an alternative DC power producing source device of nominal DC voltage being connected to said second secondary connection of said power controller in service to said at least one DC load.

84. (Canceled) The universal power system of Claim 50 wherein said power system is an alternative DC power producing source device of a second type, an alternative DC power producing source device of variable DC voltage being connected to said primary input of said power controller, at least one supplemental source of rechargeable DC power being connected to said first secondary connection with optional use of said second secondary connection.

85. (Canceled) The universal power system of Claim 50 wherein said power system is an alternative DC power producing source of a third type, a least one rechargeable source of DC power being connected to said first secondary connection and an alternative DC power producing source device of nominal DC voltage being connected to said second

secondary connection of said power controller in service to a DC-to-AC line compatible inverter in order to support at least one conventional AC load.

86. (Canceled) The power system of claim 75 wherein said power controller supports at its output a DC-to-AC line compatible inverter and at least one other DC load.

87. (Canceled) The universal power system of Claim 50 wherein said power system is a cogenerator power system of a fourth type, a cogenerator source of variable DC voltage being connected to said primary input of said power controller and at least one source of rechargeable DC power being connected to said first secondary connection with optional use of said second secondary connection in service to a DC-to-AC line compatible inverter in order to support at least one conventional AC load.

88. (Canceled) The power system of claim 80 wherein said power controller supports at its output a DC-to-AC line compatible inverter and at least one other DC load.

91. (Canceled) The universal power system of Claim 90 wherein said power system is a brown-out and over-voltage mitigating power system in service to end-use loads at its output, said system maintaining a nominally constant voltage at its output with varying voltage at its primary input to

compensate for electrical conditions where there is a precipitous drop in line or source voltage, known as a brown-out and an unstable upper and lower excursion of line voltage or source power at the primary input.

92. (Canceled) The universal power system of Claim 49 wherein said primary source of power is a source of AC with optional use of at least one of said secondary DC connection sources of DC power.

93. (Canceled) The universal power system of Claim 92 wherein said AC generator is a gas-fueled generator.

94. (Canceled) The universal power system of Claim 93 wherein said AC generator is a cogenerator.

95. (Canceled) The universal power system of Claim 49 wherein said primary source of power is one of an AC gas-fueled generator and a AC cogenerator with optional use of at least one of said secondary DC connection sources of DC power.

96. (Canceled) The universal power system of Claim 50 wherein said primary source of power is one of an AC gas-fueled generator and a AC cogenerator with optional use of at least one of said secondary DC connection sources of DC power.

97. (Canceled) The universal power system of Claim 49 wherein said at least one DC load is one of lighting, office equipment, electronic devices, motor drive apparatus, DC-to-AC line inverter and an end-use device capable operating at the DC output voltage of said power controller.

98. (Canceled) The universal power system of Claim 50 wherein said at least one DC load is one of lighting, office equipment, electronic devices, motor drive apparatus, DC-to-AC line inverter and an end-use device capable operating at the DC output voltage of said power controller.

99. (Canceled) The universal power system of Claim 49 wherein said at least one DC load is a DC to AC 60 Hz inverter, said power system being acceptable to devices that operate on standard AC line voltages at the output of said inverter.

100. (Canceled) The universal power system of Claim 50 wherein said at least one DC load is an 60 Hz inverter, said power system being acceptable to devices that operate on standard AC line voltages at the output of the inverter.

101. (Canceled) The universal power system of Claim 49 wherein said power system is a unitary and modular package, said package forming a building block which may be installed

in incremental units for greater service capacity.

102. (Canceled) The universal power system of Claim 50, wherein said power system is a unitary and modular package, said package forming a building block which may be installed in incremental units for greater service capacity.

103. (Canceled) The universal power system of Claim 101 wherein said power system is applied with outputs connected in series for greater voltage and power capacity.

104. (Canceled) The universal power system of Claim 102 wherein said power system is applied with outputs connected in parallel for greater current capacity and power capacity thus for flexible building blocks.

105. (Canceled) The universal power system of Claim 101, wherein said unitary and modular package is connected in close physical proximity with individual output circuit legs to said loads, and remote from said primary input power source connection, thus minimizing load-side voltage drops when said power controller's DC output voltage is a low output voltage; said at least one DC load leg comprising a plurality of DC load legs clustered around said modular universal power system.

106. (Canceled) The universal power system of Claim

102, wherein said unitary and modular package is connected in close physical proximity with individual output circuit legs to said loads and remote from said primary input power source connection, thus minimizing load-side voltage drops when said power controller's DC output voltage is a low output voltage; said at least one DC load leg comprising a plurality of DC load legs clustered around said modular universal power system.

107. (Canceled) The universal power system of Claim 49, wherein said power system is an emergency lighting system in service to a lighting load with a source of primary power connected at the input and with a storable power source at said at least one secondary connection with circuitry to insure operation from the storage during primary power interruptions at said primary input.

108. (Canceled) The universal power system of Claim 50, wherein said power system is an emergency lighting system in service to a lighting load with a source of primary power connected at the input and with a storable power source at said first secondary connection with circuitry to insure operation from the storage during primary power interruptions at said primary input.

109. (Canceled) The universal power system of Claim 101, wherein said power system is an emergency lighting

system in service to a lighting load with a source of primary power connected at the input and with a storable power source at said at least one secondary connection with circuitry to insure operation from the storage during primary power interruptions at said primary input.

110. (Canceled) The universal power system of Claim 102, wherein said power system is an emergency lighting system in service to a lighting load with a source of primary power connected at the input and with a storable power source at said first secondary connection with circuitry to insure operation from the storage during primary power interruptions at said primary input.

111. (Canceled) The universal power system of Claim 49 wherein said power system is an emergency power system in service to any electrical load at its output, a source of primary power being connected at the input and a storable power source provided at said at least one secondary connection to insure operation during primary power interruptions.

112. (Canceled) The universal power system of Claim 50 wherein said power system is an emergency power system in service to any electrical load at its output, a source of primary power being connected at the input and a storable power source being provided at said first secondary

connection to insure operation during primary power interruptions.

113. (Canceled) The universal power system of Claim 101 wherein said power system is an emergency power system in service to any electrical load at its output, a source of primary power being connected at the input and a storable power source being provided at said at least one secondary connection to insure operation during primary power interruptions.

114. (Canceled) The universal power system of Claim 102 wherein said power system is an emergency power system in service to any electrical load at its output, a source of primary power being connected at the input and a storable power source being provided at said first secondary connection to insure operation during primary power interruptions. --
